★ ★ ★ ★ ★

You are given an integer N followed by N email addresses. Your task is to print a list containing only valid email addresses in lexicographical order.

Valid email addresses must follow these rules:

- It must have the username@websitename.extension format type.
- The username can only contain letters, digits, dashes and underscores $[a - z], [A - Z], [0 - 9], [\_-]$.
- The website name can only have letters and digits $[a - z], [A - Z], [0 - 9]$.
- The extension can only contain letters $[a - z], [A - Z]$.
- The maximum length of the extension is 3.

Concept

A filter takes a function returning True or False and applies it to a sequence, returning a list of only those members of the sequence where the function returned True. A Lambda function can be used with filters.

Let's say you have to make a list of the squares of integers from 0 to 9 (both included).

```
>> l = list(range(10))
>> l = list(map(lambda x:x*x, l))
```

Now, you only require those elements that are greater than 10 but less than 80.

```
>> l = list(filter(lambda x: x > 10 and x < 80, l))
```

Easy, isn't it?

Example

Complete the function fun in the editor below.

fun has the following paramters:

- string s: the string to test

Returns

- boolean: whether the string is a valid email or not

Input Format

The first line of input is the integer N, the number of email addresses.
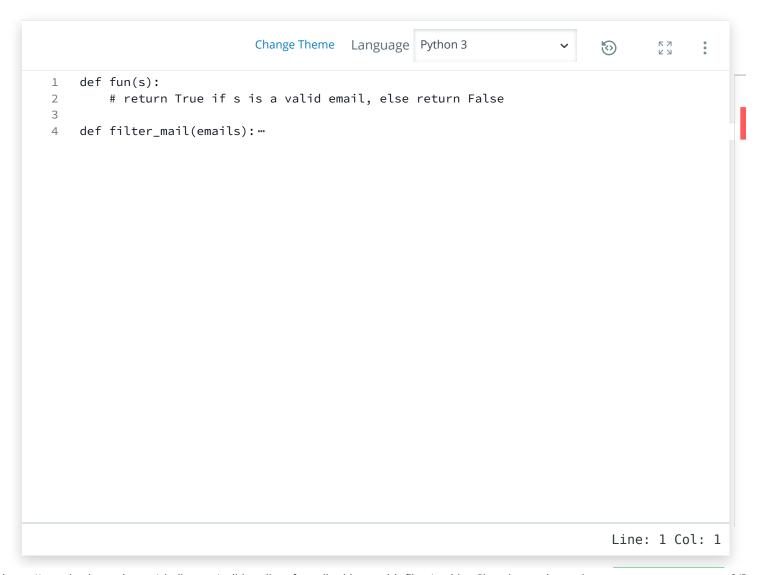

N lines follow, each containing a string.

Constraints

Each line is a non-empty string.

Sample Input

```
3
lara@hackerrank.com
brian-23@hackerrank.com
britts_54@hackerrank.com
```

Sample Output

```
['brian-23@hackerrank.com', 'britts_54@hackerrank.com', 'lara@hackerrank.com']
```

Change Theme   Language   Python 3   ⌄   ↺   ⤢   ⋮

```python
1   def fun(s):
2       # return True if s is a valid email, else return False
3
4   def filter_mail(emails):⋯
```
